DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-7 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent 4,860,026 by Matsumoto et al. ("Matsumoto").

Regarding claims 1-3 and 7, Matsumoto discloses an inkjet printer as a recording apparatus (figure 1) that records image data in a plurality of gradations, comprising the steps of inputting multi-value level image data (element 16, figure 2), quantization means (element 17, figure 3) for quantizing (figure 5) the image data for a first and second recording means (element 19, figure 3), and recording the image data with three or more levels in a plurality of gradations.

Referring to figures 5-1 and 5-2, eight-bit image data, corresponding to 256 unique image levels, is quantized into 68 output levels. Each of the 68 levels encompasses two recording means, thick ink dots and thin ink dots, which record in combination to form 68 output gradations (column 4, lines 66-68).

Regarding claim 4, the first and second recording means record the image with light and black ink (element 19, figure 3). The thin concentration ink dots are thinner and thus lighter than the thick concentration ink dots, which are darker (column 3, lines 19-20).

Art Unit: 2623

Regarding claims 5 and 6, thin and thick ink droplets are recorded in a plurality of gradations and in combination within a region (figure 5 and column 4, lines 66-68).
